

PR Portfolio — Product Strategy Report

Prepared 2026-07-30. Research-only deliverable — no code was changed to produce this report.

1. Executive Summary

PR Portfolio's codebase today is a well-built **single-user personal dashboard** (internally "Vitality") that has been recently *reskinned* with PR Portfolio branding and a prototype `/profile` page. It is not yet the **two-sided "LinkedIn for Physical Performance"** platform described in the business concept. The gap between the brand promise and the current architecture is the single most important fact in this report: there is no auth, no second-user concept, no verification pipeline, and no discovery surface anywhere in the code. The "Share profile" and "Public/Private" controls on `/profile` are UI-only — commented in the code itself as *"No real access control yet — this is a single-owner prototype."*

That said, the parts that *are* built are genuinely good and directly useful to the eventual product: a deterministic, well-reasoned PR/1RM-derivation engine (Train → Velocity → Profile), a cross-tile AI "noticing" layer, and a sealed-tile architecture that already enforces the security discipline (no direct network access from any tracked data surface) that a credibility platform will eventually need.

Across 26 competitors researched, **no product combines a personal, multi-metric athletic portfolio with provenance-graded credibility** the way OpenPowerlifting does for competition results or StrengthLevel does for percentile framing — but neither of those is a personal profile product. That is PR Portfolio's open lane, and it doesn't require AI to win it — it requires a *credibility system* (evidence, source labels, confidence levels, witnesses) that nobody in the consumer fitness-app category has built.

Recommended position: PR Portfolio should become a **performance credibility platform — the evidence-backed, portable athletic record an athlete owns for life** — not a workout generator, not a calorie tracker, not a Strava clone. The initial niche should be **competitive/aspiring powerlifters and strength-focused hybrid athletes**, the group with the clearest existing behavior (they already chase verifiable numbers, already compare against standards like StrengthLevel/OpenPowerlifting, and already have real occasions — meets, tryouts, gym rankings — where a credible record has stakes).

2. Honest Assessment of Current Competitiveness

Today, PR Portfolio could not be sold to a second person. Not because the underlying engineering is weak — it isn't — but because the product that would justify payment (a discoverable, verifiable, shareable athletic record) doesn't exist yet in any usable form. What exists is a very good personal tool for the founder, wearing a product name for something bigger.

The good news: nothing here needs to be thrown away. The Train/Velocity PR-derivation logic, the tile-bridge security model, and the AI-mentor pattern-noticing are exactly the ingredients a credibility platform needs. The work ahead is primarily **additive** (auth, evidence storage, provenance schema, discovery) rather than corrective. See §10 for the roadmap that builds on this without breaking it.

3. Codebase Audit (Phase 1 — Confirmed Findings)

Conducted via full read-only review of the repository at `/Users/asunderrex92679/VS Code Singh-Shiesty`. All items below are confirmed against actual code unless marked *INFERENCE*.

Architecture snapshot

- **Single-user, no auth.** `userId="me"` is hardcoded in `app/page.tsx` and `app/api/vitals/ingest/route.ts`. Supabase RLS policies on both live tables (`tile_data`, `tiles`) are for all using `(true)` with `check (true)` — open to anyone holding the public anon key. A separate `backend.sql` with real multi-user, `auth.uid()`-scoped schema exists at the repo root but is **not wired to any live code path** — a leftover/reference artifact, not the real backend.
- **/profile page exists** (`app/profile/`), titled "Profile · PR Portfolio," styled explicitly in its own code comment as "a combination of LinkedIn, Strava, and a professional sports portfolio." Its "Share profile" button only copies the current URL to the clipboard — it does not create a distinct public view, has no viewer/owner distinction, and its own "Visibility" field is annotated in-code as non-functional.
- **Sealed, no-network tile architecture.** Tiles (`public/tiles/*.html`) run as sandboxed iframes that can only persist data through a narrow `window.Vitality` bridge — good security discipline, but it means any new social/verification feature (uploads, cross-user reads, moderation calls) must be proxied through new host-side API routes, following the existing Spotify/Finnhub pattern.
- **No file/image upload pipeline.** Every image field (profile photo, cover photo) is a raw URL text input — "file upload comes later" is the code's own comment. This directly blocks evidence-attachment (photo/video proof of a PR), a core requirement of the credibility positioning.
- **MCP connector uses a single shared secret** (`MCP_TOKEN`), fine for one owner, not scoped for multiple users.

What already exists and works

- **Train** (workout logger, ~3,300 lines) — tiered, cued exercise library; full set/rep/weight history per lift.
- **Velocity** — derived, read-only view computing Epley-formula estimated 1RM, distinguishing "Verified PR" (a weight actually logged) from "Estimated 1RM," with plateau/fatigue flagging.
- `prMoments()` / `bestOf()` in `ProfilePage.tsx` — a genuinely well-reasoned deterministic reconstruction of "was this a PR when it was logged," duplicated consistently between Velocity and Profile with no schema changes needed to Train's data.
- **A `RecordStatus` type already anticipates credibility grading** — `'self-reported'` | `'evidence-attached'` | `'competition-result'` | `'community-endorsed'` — but every card is currently hardcoded to render only `'self-reported'`. This is the single most important half-built piece in the codebase: **the credibility data model is already sketched, just not implemented.**
- **Graceful degradation** — the whole app runs on `localStorage` with zero env vars; every server-backed feature fails soft rather than crashing.

What's missing relative to the "LinkedIn for Physical Performance" vision

No accounts/login, no discovery or browse of other athletes, no following/messaging, no leaderboards, no verification pipeline, no video/photo evidence attachment, no sprint-time / vertical-jump / body-composition tracking, no recruiter/brand/gym-facing surface, no public API or embeddable stat badge.

Confusing / underdeveloped areas found

- Two contradictory backend schemas (`backend.sql` vs. `supabase/sync.sql` + `tiles.sql`) with no cross-reference comment explaining which is authoritative.
- `tiles-library/*.html` (the `/vitality` reinstall source) has historically drifted from `public/tiles/*.html` styling — a manual-parity risk.
- `RECORD_STATUS_LABEL` defines four states but renders only one — dead code paths.
- Peak tile's header comment references React components (`StimQuickLog.tsx` , etc.) that no longer exist under `app/` — a stale trace of prior refactoring.

The clearest reason someone would pay today, and the clearest reason they'd refuse

- **Pay:** the AI-mentor-driven cross-tile equation, with genuinely working PR/1RM derivation and a live "talk to your dashboard" MCP connector, is a materially more integrated personal analytics system than a spreadsheet — for a self-hosting power user.
 - **Refuse:** there is no product in the social/marketplace sense the name promises. No second person can see, verify, or discover anyone's profile. The "Share" and "Public/Private" controls are decorative.
-

4. Competitive Research Methodology (Phase 2)

Three parallel research passes covered 26 platforms via live web search, prioritizing official product/pricing/developer-docs pages, with source links and 2026-07-30 access dates preserved. Full per-platform dossiers (value prop, features, AI, pricing, API access, complaints, what to learn/avoid, with citations) are in **Appendix A**. Key cross-cutting findings are synthesized below and drive the positioning, matrix, and roadmap sections.

Headline findings: 1. **AI is table stakes and shallow everywhere.** Every logging app researched (Hevy, Strava, Fitbod, Boostcamp, Gravl) shipped some AI feature in 2026 — auto-progression, chat Q&A, insight summaries. None verify or credential achievements. Garmin Connect+'s AI insights were publicly panned as "restating the obvious" — a live warning that low-value AI erodes trust in the label itself. 2. **No competitor combines a personal athletic portfolio with provenance-graded credibility.** The closest analogs — OpenPowerlifting (hand-verified, federation-sourced competition results, correction-by-authoritative-source, tested/untested segmentation) and StrengthLevel (percentile framing from ~195M crowd-sourced lifts with statistical outlier filtering) — are reference databases, not personal profile products. **This is the whitespace.** 3. **Subscription-gated hardware and retroactive paywalling are recurring, well-documented trust failures:** WHOOP's device bricked without membership, Oura's alleged bait-and-switch (now in litigation), Strava paywalling the previously-free "Year in Sport" recap. A credibility/ownership-positioned product should explicitly contrast itself against this pattern. 4. **Wearable API access is highly uneven** — WHOOP (open self-serve OAuth) > Oura (open API, but gated by the *end user's* own membership status) > Apple Health (open but device-local, requires a native iOS component) > Garmin (partner-approval only, **reportedly closed to new applicants as of 2026**) > Bevel/Athlytic (no public API) > Peloton (no official API, only fragile unofficial specs) > Nike Run Club (no API, actively blocked third-party access in 2024). 5. **Social mechanics split into three families:** broad public feed+leaderboard (Strava, Peloton), thin follow/share (Hevy), closed cohort/team (Ladder) — or nothing (Strong, Fitbod, Athlytic). None model a public, résumé-style credible record. 6. **Monetization pattern:** organically-growing apps (Hevy, Gravl, Load Muscle) put core/AI features on a generous free tier and monetize convenience/depth; older or acquisition-driven apps (MyFitnessPal, Cal AI, MacroFactor) monetize the core value directly and draw the most complaints for it. 7. **Nutrition is broadly underserved among recovery wearables** (WHOOP, Oura, Athlytic, Nike RC all lack native nutrition tracking) — a secondary, smaller white-space signal, not the primary opportunity.

5. Competitive Matrix (Phase 3)

Capability	PR Portfolio Today	Market Leader(s)	Label for PR Portfolio	Note
Strength tracking (logging)	Strong (Train)	Hevy, Strong, Fitbod	Strong	Already competitive; don't rebuild
PR / 1RM detection	Strong (Velocity, deterministic)	Hevy (algorithmic), Gravl (Strength Score)	Strong	Genuinely ahead of most on rigor, not on polish
AI coaching	Partial (Mentor, off-platform via Claude Code)	Fitbod, Gravl, WHOOP Coach, Oura Advisor	Not strategically relevant as primary bet	Category is saturated and increasingly distrusted when shallow
Nutrition	Partial (Fuel: water/macros)	MyFitnessPal, MacroFactor, Cal AI	Not strategically relevant to lead with	Deep nutrition tracking is a crowded, low-differentiation fight
Recovery	Partial (Vitals: sleep/feel)	WHOOP, Oura, Garmin	Not strategically relevant to lead with	Can't out-hardware wearable incumbents; can <i>import</i> their data instead
Social networking	Missing	Strava, Peloton, Hevy	Potential differentiator	Only if built around credibility, not a generic feed
Athlete profiles	Missing (prototype only, no access control)	none directly comparable	Potential differentiator	Core of the recommended position
Performance credibility (evidence/provenance)	Missing (data model sketched, unrendered)	OpenPowerlifting (adjacent, not personal)	Potential differentiator — the primary one	No consumer competitor owns this
Achievement evidence (photo/video proof)	Missing (no upload pipeline)	none in category	Potential differentiator	Real engineering lift (\$11) but high defensibility
Progress visualization	Strong (Velocity charts)	Hevy, MacroFactor	Strong	Keep, extend to more metrics

Capability	PR Portfolio Today	Market Leader(s)	Label for PR Portfolio	Note
Cross-sport support	Missing (strength-only; no sprint/jump/body-comp)	none unify these either	Missing, worth closing later	Not urgent for initial niche (powerlifting-adjacent)
Recruiter/coach/brand visibility	Missing	TrainHeroic (coach-side only)	Potential differentiator	Long-term, not MVP
Data ownership and export	Partial (localStorage-first, CSV not yet on profile data)	Strong (CSV export), OpenPowerlifting (full open data)	Potential differentiator	Cheap to ship, high trust value, direct contrast to Nike RC's API lockdown
Integrations (wearables)	Partial (Spotify, Finnhub, YouTube; WHOOP unwired)	Strava, Garmin, WHOOP	Partial, expand selectively	See §9E for feasibility ranking
Gamification	Missing	Peloton (Club Peloton), Apple Fitness (rings/badges)	Not strategically relevant to lead with	Avoid manipulative loops per the user's own constraint
Community	Missing	Strava, Ladder, Peloton	Potential differentiator, secondary	Only after credibility layer exists — community without a reason to compare is generic
Monetization	Missing (no live billing)	see Appendix A for full spectrum	Missing, straightforward to add	See §8

Oversaturated — PR Portfolio should not try to win here: generic AI program generation, calorie/macro tracking depth, wearable-hardware-based recovery scoring, generic public activity feeds.

Underserved — real opportunity: provenance-graded achievement credibility, a portable/exportable athletic record, cross-context visibility (coach/recruiter/brand) for *non-professional* athletes, standardized-yet-flexible cross-sport PR representation.

6. Defensible Position (Phase 4)

Recommended target audience

Competitive and aspiring powerlifters / strength-focused hybrid athletes, not personal trainers, not general recreational gym-goers, not bodybuilders (physique is subjectively judged, not numerically comparable the way lifts are).

Why this group over the alternatives: - They already behave like the product needs them to: they chase verifiable numbers (StrengthLevel, OpenPowerlifting traffic proves this demand exists), they already compete or want to, and they already understand percentile/Wilks-style framing. - They have **real, recurring occasions where a credible record has stakes** — meet entry, weight-class planning, gym/team tryouts, training-partner bragging rights — unlike a casual gym-goer who has no audience for their numbers. - The existing codebase (Train's tiered lift library, Velocity's 1RM/PR logic) is already built for exactly this population — the audience choice requires the least retrofitting. - Willingness to pay is provable: this population already pays for Boostcamp (\$5–15/mo), EvolveAI (\$15–21/mo, official Powerlifting America app), and TrainHeroic — they are not price-sensitive about strength-specific tools the way a general MyFitnessPal user is about calorie tracking.

Non-varsity college athletes and hybrid athletes are strong **secondary** expansion audiences once the credibility model is proven — the strength-numbers framing generalizes to them without a rebuild.

Primary positioning statement

PR Portfolio is the evidence-backed, portable athletic record you own for life — the credibility layer strength and hybrid athletes have never had, without requiring a certified trainer to sign off on every rep.

Why this beats the alternatives considered: - "*Verified résumé for physical performance*" — implies live verification, which is explicitly out of scope; "evidence-backed" instead of "verified" is accurate to what's actually being built (source labels, confidence levels, community witnesses) and avoids overpromising. - "*Digital athletic identity*" — too abstract; doesn't explain why anyone would pay or what's in the product. - "*Cross-sport achievement network*" — the network effect isn't earned yet (no users, no discovery), and cross-sport breadth is explicitly not where the current codebase or initial niche is strong. - "*Personal record intelligence system*" — reduces the product to analytics, undersells the identity/ownership angle that creates multi-year retention (\$6, Q2). - "*Career and sponsorship portfolio*" — real but premature; it's a monetization layer for Phase 5, not the reason someone signs up on day one.

"Credibility layer" is the right noun because it's the one thing every researched competitor is missing (§4, finding 2), it maps directly onto the codebase's already-sketched `RecordStatus` type, and it doesn't require

AI, live verification, or a social graph to start delivering value.

Answers to the strategic questions

- 1. What can PR Portfolio offer that Strava, Cal AI, Hevy, WHOOP, and MyFitnessPal cannot easily replicate?** A credibility grading system for self-reported numbers (source labels, evidence attachments, confidence levels, community witnessing) tied to a *portable, athlete-owned* record. All five of those platforms are built around different core loops (segments/feed, photo-calorie-logging, program+social, recovery scoring, food database) that would require rearchitecting their entire product to bolt this on — it's not a feature gap, it's a different product thesis.
- 2. What would make a user maintain this profile for years?** The record itself becomes more valuable the longer it runs — a 5-year PR trajectory with evidence is a fundamentally different asset than a 5-week Hevy streak. This mirrors why people keep LinkedIn profiles current long after they've stopped actively job-hunting: identity capital compounds.
- 3. What creates network effects or switching costs?** Two-sided: athletes want to be *seen* by coaches/recruiters/training partners who are also on the platform (classic network effect), and the accumulated evidence-backed history itself is a switching cost — exporting is possible (and should be, per the data-ownership stance), but *rebuilding provenance elsewhere* is not.
- 4. What information becomes more valuable as users add more history?** Trajectory (rate of improvement, not just current max), consistency-under-adversity (did they keep progressing through a plateau, an injury, a cut), and third-party-witnessed moments — none of these exist without years of accumulated, dated, evidence-linked entries.
- 5. What gives people a reason to share their profile publicly?** The same reason people share a LinkedIn profile: it costs nothing to maintain privately but gains value the moment someone with leverage (a coach, a meet director, a training partner, a brand) is looking. Athletes already screenshot PR moments for Instagram — PR Portfolio gives that impulse a permanent, credible home instead of a disappearing story.
- 6. What could make coaches, recruiters, gyms, teams, event organizers, or brands care?** A standardized way to pre-screen credibility before investing time — a meet director gets fewer disputed entries, a gym gets a lower-friction way to run an internal leaderboard with actual proof behind it, a supplement brand gets a way to find genuinely strong athletes instead of just large followings.
- 7. Which target audience has the strongest pain point and willingness to pay?** Competitive/aspiring powerlifters and hybrid athletes (see above) — proven by existing spend on Boostcamp, EvolveAI, and TrainHeroic, and by the organic existence of StrengthLevel/OpenPowerlifting traffic with zero marketing budget behind either.
- 8. Should the initial niche be powerlifters, hybrid athletes, bodybuilders, PTs, recreational athletes, non-varsity college athletes, or another group?** Powerlifters and hybrid athletes, in that order — see rationale above. Bodybuilders are a weaker fit (physique judging isn't numerically portable the way a lift total is); personal trainers are a *later* B2B expansion (coach-view dashboards, \$7D), not the wedge; recreational athletes lack the stakes that make credibility matter; non-varsity college athletes are the

strongest **second** niche (they have team/tryout stakes but the current codebase isn't built for team structures yet).

7. Original Feature Concepts (Phase 5)

Concepts only — no protected branding, wording, or UI copied from any competitor. Each adapts a product principle observed in research into an original PR Portfolio mechanic.

A. Performance Portfolio

- **Athlete profile with owner-controlled visibility tiers** (private / link-only / public) — actually enforced server-side, unlike today's decorative toggle.
- **PR timeline** — chronological, evidence-linked view of every verified-status change per lift (extends the already-built `prMoments()` logic).
- **Milestone collections** — curated groupings (e.g., "Meet Prep — Spring 2027") an athlete assembles from their own history, distinct from the raw timeline.
- **Custom profile sections** — reuses the existing tile/section pattern (`CLAUDE.md` 's "wire a new section into the button row" convention) rather than inventing a new content model.
- **Printable/exportable résumé** — already partially exists (`window.print()` in `ProfilePage.tsx`); extend to a clean PDF/CSV export as a trust signal (direct contrast to Nike RC's API lockdown, §4 finding 3).

B. Performance Credibility (no live trainer verification)

- **Evidence attachment per PR** — photo/video proof, stored via a new upload pipeline (the current biggest missing technical piece, §11).
- **Source labels** — "self-reported," "device-imported" (e.g., a WHOOP-verified rep count), "evidence-attached," "community-witnessed," "competition-result" — this is exactly the `RecordStatus` enum already sketched in `lib/tiles/profile.ts`, finally rendered and made real.
- **Confidence levels, not binary verification** — a graded badge (not a pass/fail check mark) communicating how much evidence backs a number, avoiding the excluded live-certified-trainer model entirely.
- **Community witnessing** — a training partner who was present can co-sign an entry (lightweight, no certification required) — same spirit as OpenPowerlifting's correction-by-source model, scaled down to peer level.
- **Unrealistic-entry flagging** — statistical sanity-checking (borrowing `StrengthLevel`'s outlier-filtering principle) against age/bodyweight/lift ratios, surfaced as a gentle "double-check this" prompt, not an

accusation.

C. AI Intelligence (supporting, not the headline)

- Automatic PR detection (already built in Velocity — extend across new metrics as they're added).
- Plateau detection (already built — extend).
- Weekly performance reviews and "why did this change" explanations, generated from the same cross-tile noticing pattern the Mentor already does for goal weights.
- Personalized next-milestone predictions, framed as trajectory estimates, not guarantees.
- AI-generated athlete-profile summaries — a one-paragraph "here's what this record shows" written for a coach/recruiter audience, not the athlete themselves.
- Injury-risk signals presented as training-load pattern observations ("volume jumped 40% in two weeks") — never phrased as medical diagnosis.

D. Social and Career Value

- Follow athletes by sport/lift/training style (Hevy's model), but tie the feed to *credibility-graded* achievements, not just any logged set — the differentiator is what gets surfaced, not the follow mechanic itself.
- Shareable achievement cards carrying their confidence badge, so a shared PR is legible as credible even to someone who's never used the app.
- Training groups / gym leaderboards with consent-based privacy (opt-in, not default-public — direct contrast to Strava's and Garmin's default-feed patterns).
- Coach-view dashboards — a read-only, athlete-granted view for an actual coach (not a certification system, just a visibility grant).
- Sponsorship media kits — an exportable, evidence-backed one-pager a brand can trust faster than an Instagram follower count.
- Recruiting/tryout portfolios — same export mechanism, targeted at a team/program context.
- Searchable skills/achievements — e.g., "500lb+ raw deadlift, tested-adjacent confidence" as a filterable, standardized query, borrowing OpenPowerlifting's tested/untested segmentation idea.

E. Integrations — feasibility summary (full detail in Appendix A)

Integration	API access today	Strategic value	Recommendation
WHOOP	Open, self-serve OAuth (membership required)	High — strength/recovery data with real provenance value	Build early

Integration	API access today	Strategic value	Recommendation
Oura	Open API v2, but gated by end-user's own active membership	Medium	Build if user demand appears
Apple Health	Open, but requires a native iOS component (device-local data)	High long-term, real engineering cost	Phase 4+ , needs a companion app
Garmin Connect	Partner-approval only, reportedly closed to new applicants	Medium	Don't plan around it; revisit if reopened
Strava	Broad device ecosystem, no info found suggesting open data-pull terms beyond their own MCP connector	Medium	Investigate their MCP connector as an unusual, lower-friction path
Fitbit	Not deeply researched this pass	Low priority for strength-first niche	Defer
Spotify	Already integrated (Symphony tile)	N/A	No action needed
MyFitnessPal / nutrition	Large incumbent, acquisition-consolidated (owns Cal AI)	Low — nutrition isn't the wedge	Don't build; consider CSV import only
Smart scales	Not researched	Medium (body comp gap)	Defer to post-MVP
Competition databases (OpenPowerlifting)	Fully open, free, bulk CSV export	High — directly strengthens the credibility model	Build early — import a lifter's real competition history as instant, gold-standard evidence
CSV / manual import	Trivial, no API dependency	High, zero-risk	Build first

F. Retention and Monetization

- Free tier: full personal logging + PR/1RM derivation (already built) + basic profile — matches the "generous free core" pattern that correlated with organic growth (Hevy, Gravl) rather than the "crippled free tier" pattern that draws the most complaints (MyFitnessPal, Cal AI).

- **Athlete Pro:** evidence storage beyond a basic cap, advanced trajectory analytics, exportable résumé/media kit, priority in coach/recruiter search.
- **Coach/Gym tier:** multi-athlete dashboard, consent-based team leaderboard.
- Data export: free, always — this is a trust commitment, not a monetized feature (direct contrast to Nike RC's API lockdown).
- Achievement systems: milestone badges tied to *real, evidence-graded* accomplishments only — explicitly avoid streak-guilt mechanics or manufactured urgency, per the user's own constraint.

8. Prioritization (Phase 6)

Scored 1–10. UV=User Value, Diff=Differentiation, WTP=Willingness to Pay, Ret=Retention, Feas=Technical Feasibility, Eff=Development Effort (10=low effort), Risk=Privacy/Legal Risk (10=low risk), Align=Alignment with PR Portfolio thesis, ST=Short-term impact, LT=Long-term defensibility.

Recommendation	UV	Diff	WTP	Ret	Feas	Eff	Risk	Align	ST	LT
Real auth + multi-tenant data model	9	3	2	6	6	3	9	10	4	10
Enforced profile visibility (private/link/public)	8	4	3	5	8	7	8	10	7	8
CSV/manual import for existing lift history	6	3	3	5	9	8	9	7	8	5
OpenPowerlifting competition-history import	8	9	6	7	7	6	8	10	6	9
Evidence attachment (photo/video) + upload pipeline	9	9	7	8	5	4	6	10	4	10
Source labels / confidence levels (render RecordStatus)	9	10	7	8	8	8	8	10	8	10
Community witnessing (peer co-sign)	7	8	5	7	6	5	6	9	4	8
Unrealistic-entry flagging	6	6	3	4	6	6	7	8	3	6
Exportable résumé/media kit	7	7	6	6	7	7	9	9	6	7
Coach-view dashboard	6	6	6	6	6	5	7	8	3	7
Follow + credibility-graded feed	6	6	4	6	5	4	6	7	3	7
Consent-based gym/team leaderboard	6	5	5	6	5	5	6	7	3	6
WHOOP integration	5	5	3	5	7	6	7	6	3	5
Apple Health integration (native companion)	5	4	3	5	3	2	6	5	1	5

Recommendation	UV	Diff	WTP	Ret	Feas	Eff	Risk	Align	ST	LT
Weekly AI performance review	6	4	4	6	7	7	8	7	5	5
AI-generated profile summary (for coach/recruiter)	5	5	4	4	7	7	8	7	4	4
Sprint/vertical-jump/body-comp tracking	5	3	3	4	7	6	8	5	3	4

Buckets

- **Quick wins (1–2 weeks):** CSV/manual import; enforced profile visibility (server-side, not decorative); rendering the existing `RecordStatus` labels honestly (even before full evidence upload, just stop hardcoding "self-reported").
- **Near-term (1–2 months):** Evidence attachment + upload pipeline; OpenPowerlifting competition import; unrealistic-entry flagging; exportable résumé/media kit.
- **Strategic (3–6 months):** Real auth + multi-tenant data model; community witnessing; coach-view dashboard; follow + credibility-graded feed.
- **Long-term platform opportunities:** Consent-based gym/team leaderboards; brand/recruiter discovery surface; native Apple Health companion app; sprint/vertical-jump/body-composition expansion into a true cross-sport model.
- **Reject or postpone:** Generic AI workout generation (saturated, not differentiated); deep nutrition tracking (crowded, not the wedge); gamified streak/badge mechanics disconnected from real achievement (explicitly against the user's own constraint); Garmin integration (currently closed to new API applicants — don't plan around it).

Top five highest-priority features

1. Source labels / confidence levels (render the existing `RecordStatus` model) - *User problem:* A logged PR currently means nothing to anyone but the athlete — no way to signal "this is real." - *Target user:* Competitive powerlifters wanting their record to mean something to a coach or meet director. - *Proposed experience:* Every PR card shows a graded badge (self-reported → device-imported → evidence-attached → competition-result → community-witnessed), replacing the currently-hardcoded "self-reported" label. - *Why competitors don't solve this:* Every logger researched (Hevy, Strong, Fitbod) treats every entry as equally true; no consumer app grades credibility. - *Why someone would pay:* A higher-confidence profile is the entire value proposition of "showing" your record to someone with leverage. - *Required data:* The type already exists in `lib/tiles/profile.ts` — this is primarily a rendering and data-entry-flow change, not new schema. - *Privacy considerations:* None beyond existing profile visibility. - *Dependencies:* Should ship alongside enforced visibility controls so a graded profile has somewhere safe to live. - *Development complexity:* Low — the hardest part (the data model) is already designed. - *Success metrics:* % of PRs with a non-"self-reported" status; profile share-link click-throughs. - *MVP:* Manual status selection at entry time

(no verification, just honest self-labeling with the option to attach a source). - *Future*: Automated status assignment when data arrives via a verified integration (WHOOP-logged reps, OpenPowerlifting import).

2. Evidence attachment (photo/video) + upload pipeline - *User problem*: No way to prove a lift happened, and no way to build the upload infrastructure the whole credibility thesis depends on. - *Target user*: Same — powerlifters/hybrid athletes wanting a durable, provable record. - *Proposed experience*: Attach a photo or short video clip to any logged PR; stored, linked, and displayed on the timeline and share cards. - *Why competitors don't solve this*: None of the loggers researched (Hevy, Strong, Fitbod, Boostcamp) attach evidence to individual entries; it's outside their product thesis. - *Why someone would pay*: Storage/bandwidth cost is real; a generous-but-capped free tier with paid expansion is a natural, honest monetization lever (unlike calorie-tracker paywalls that gate core logging). - *Required data*: New media storage (Supabase Storage or equivalent), new `evidence` table linked to lift entries. - *Privacy considerations*: Media containing a person's face/body needs the same visibility controls as the rest of the profile — no separate leak path. - *Dependencies*: Needs real auth first (can't safely scope uploads to "me"). - *Development complexity*: Medium — new storage integration, no existing pattern in the codebase to build on (flagged in the audit as the biggest missing piece). - *Success metrics*: % of PRs with attached evidence; storage cost per active user vs. Pro conversion rate. - *MVP*: Single photo per PR, capped free storage. - *Future*: Video, multi-angle evidence, auto-thumbnail extraction for share cards.

3. OpenPowerlifting competition-history import - *User problem*: A lifter who has competed has zero way to bring that gold-standard, third-party-verified history into their profile — they'd have to retype it as "self-reported," losing all its credibility. - *Target user*: Any athlete who has competed in a sanctioned meet. - *Proposed experience*: Search/match by name+federation, one-click import of full competition history as pre-labeled `'competition-result'` entries. - *Why competitors don't solve this*: No consumer fitness app connects to OpenPowerlifting at all; it's an open, free dataset nobody in this category has integrated (§4 finding 2, Appendix A §8). - *Why someone would pay*: This single feature makes PR Portfolio's credibility claim instantly real for a meaningful chunk of the target niche on day one — a strong wedge for a Pro-tier "full history import" feature. - *Required data*: OpenPowerlifting's public CSV export (bulk, free, no API key needed). - *Privacy considerations*: Public competition data already; matching to the right athlete (name collisions) needs a manual confirm step, not auto-match. - *Dependencies*: None beyond CSV parsing — no auth or storage prerequisite. - *Development complexity*: Low-medium — data is free and open; matching UX is the main design work. - *Success metrics*: # of profiles with an imported competition history; conversion lift for users who complete the import. - *MVP*: Manual search + confirm + one-time import. - *Future*: Periodic re-sync as new meet results are published.

4. Enforced, server-side profile visibility - *User problem*: The current "Share profile" and "Public/Private" controls are decorative — sharing today means giving away edit access to a single-owner page. - *Target user*: Any athlete who wants to show their profile to one specific coach/recruiter without exposing it to the world, or vice versa. - *Proposed experience*: A real visibility model (private / link-only / public) enforced server-side, with a genuinely separate read-only viewer experience. - *Why competitors don't solve this differently*: This isn't a competitive-differentiation feature — it's a **prerequisite** every social feature in this report depends on, and it doesn't exist today despite the UI implying it does. - *Why someone would pay*: Not

directly monetized, but without it nothing else in this report (sharing, coach dashboards, recruiter visibility) can ship credibly. - *Required data*: Requires the multi-tenant auth work (§8 row 1) to be meaningful — a visibility flag without real accounts is still just decoration. - *Privacy considerations*: This is the privacy feature — get it right before shipping anything social. - *Dependencies*: Real auth (blocking dependency). - *Development complexity*: Medium, mostly gated by the auth prerequisite rather than its own logic. - *Success metrics*: Zero incidents of unintended data exposure; % of users who set a non-default visibility (signals the control is understood and used). - *MVP*: Three-state visibility, enforced at the API layer. - *Future*: Granular per-section visibility (e.g., show PRs, hide body weight).

5. Real auth + multi-tenant data model - *User problem*: Nothing above can exist safely without this — it's the architectural foundation, not a feature in itself. - *Target user*: Every future user beyond the founder. - *Proposed experience*: Standard account creation/login (Supabase Auth fits the existing stack with minimal new dependencies), replacing the hardcoded `userId="me"` and open RLS policies. - *Why competitors don't solve this differently*: N/A — this is infrastructure, not a market-facing feature. - *Why someone would pay*: Indirectly — it's what makes every paid tier in §8's monetization plan possible at all. - *Required data*: New `user_id`-scoped RLS policies on `tile_data` and `tiles`; the already-existing (but currently unused) `backend.sql` schema is a useful starting reference, not a drop-in solution — it needs review, not blind adoption. - *Privacy considerations*: This is the single highest-risk item to get wrong — must be built and tested before any real second user touches the system. - *Dependencies*: Blocking dependency for nearly everything else in this report. - *Development complexity*: High relative to other items — touches the data layer everywhere (`userId="me"` appears in multiple files per the audit). - *Success metrics*: Successful multi-user data isolation under test; zero cross-account data leakage. - *MVP*: Email/password or OAuth login via Supabase Auth, one real second account provisioned and tested end-to-end. - *Future*: SSO for coach/gym/team accounts, role-based access (athlete vs. coach vs. brand viewer).

9. Roadmap (Phase 7)

Phase 1 — Sharpen product identity and profile experience

- **Features**: Enforced server-side visibility; honest rendering of `RecordStatus` (manual self-labeling, no fake "verified" claims); CSV/manual import of existing lift history.
- **User stories**: "As an athlete, I can set my profile to link-only so only people I share the link with can see it." / "As an athlete, I can label a PR as self-reported vs. evidence-backed even before evidence upload exists."
- **Frontend**: Extend `app/profile/ProfilePage.tsx`'s visibility control to call a real API; add status-selection UI to PR entry.
- **Backend**: New `app/api/profile/[visibility]` style route enforcing access at read time.

- **Database:** No schema change needed yet if auth is deferred to Phase 2 (single-owner visibility can be a soft launch); revisit once real accounts exist.
- **Risks:** Shipping visibility controls before auth exists risks a false sense of security — must be clearly labeled as still-single-owner until Phase 2 lands.
- **Acceptance criteria:** A link-only profile is genuinely unreachable without the link; a private profile returns nothing to any other viewer.
- **Complexity:** Low. **Order:** First — everything else depends on visibility being trustworthy.

Phase 2 — PR intelligence and performance analytics

- **Features:** Real auth + multi-tenant data model; OpenPowerlifting competition-history import; unrealistic-entry flagging.
- **User stories:** "As a lifter who has competed, I can import my full meet history in one step." / "As a new user, I can create my own account instead of using the founder's."
- **Frontend:** Login/signup flow; import-and-confirm UI for OpenPowerlifting matches.
- **Backend:** Supabase Auth integration; `user_id`-scoped RLS rewrite for `tile_data / tiles`; OpenPowerlifting CSV ingestion job.
- **Database:** Add `user_id` columns + RLS policies scoped to `auth.uid()`; new `competition_results` table.
- **New APIs/services:** None external required (OpenPowerlifting data is a static bulk export, not a live API dependency).
- **Dependencies:** Phase 1's visibility work should be re-validated against real multi-tenancy once this ships.
- **Risks:** Data-migration risk moving from `userId="me"` to real accounts — must not lose the founder's own existing data during migration.
- **Acceptance criteria:** Two real, isolated accounts can each see only their own data; a competition import correctly attributes `'competition-result'` status.
- **Complexity:** High (auth) + Low (import). **Order:** Second — this is the architectural unlock everything else needs.

Phase 3 — Evidence-backed achievements and sharing

- **Features:** Photo/video evidence upload pipeline; exportable résumé/media kit; community witnessing (peer co-sign).
- **User stories:** "As an athlete, I can attach a video to my new PR." / "As a training partner, I can co-sign a lift I witnessed."
- **Frontend:** Upload UI on PR entry; new witness-request/confirm flow; export/print polish beyond the existing `window.print()`.

- **Backend:** Supabase Storage integration; new `evidence` and `witness_confirmations` tables; export-generation route.
- **Database:** `evidence(id, entry_id, media_url, uploaded_at); witness_confirmations(id, entry_id, witness_user_id, confirmed_at)`.
- **Dependencies:** Requires Phase 2's real auth (can't scope uploads or witness identities to `"me"`).
- **Risks:** Storage cost scaling with adoption; needs a sane free-tier cap from day one.
- **Acceptance criteria:** Evidence displays correctly on both the timeline and a shared card; a witness confirmation visibly changes the entry's credibility badge.
- **Complexity:** Medium-High. **Order:** Third.

Phase 4 — Selected integrations

- **Features:** WHOOP OAuth integration (open, self-serve API); investigate Strava's MCP connector as a lower-friction alternative to a full Strava API integration; defer Garmin (closed to new applicants) and Apple Health (requires a native companion app — bigger lift than its near-term value justifies).
- **User stories:** "As a WHOOP user, I can link my account so recovery/strain data appears alongside my logged PRs."
- **Frontend:** New "Connect WHOOP" flow in the profile/integrations settings, following the existing Spotify OAuth pattern in `app/api/spotify/*`.
- **Backend:** New `app/api/whoop/{authorize,callback}` routes mirroring the Spotify integration's proven pattern (shared redirect-URI handling, host-proxied calls — the sealed-tile architecture already requires this).
- **Database:** New `whoop_auth` row pattern in `tile_data`, consistent with how Spotify tokens are already stored.
- **Dependencies:** WHOOP requires an active membership on the developer's own account for API registration — a real, non-technical prerequisite to flag to the user before starting.
- **Risks:** WHOOP membership cost as a testing dependency; API rate limits not fully documented publicly.
- **Acceptance criteria:** A connected WHOOP account's recovery/strain data appears correctly attributed and does not silently overwrite manually-logged Vitals data.
- **Complexity:** Medium (directly reuses the Spotify OAuth pattern, lowering risk). **Order:** Fourth — integrations are additive polish, not foundational.

Phase 5 — Community, coach, gym, and monetization tools

- **Features:** Follow + credibility-graded feed; consent-based gym/team leaderboards; coach-view dashboard; Athlete Pro / Coach-Gym billing tiers.
- **User stories:** "As a coach, an athlete can grant me read access to their profile." / "As a gym owner, I can see an opt-in leaderboard of my members' evidence-backed lifts."

- **Frontend:** Feed UI; coach-dashboard route; billing/upgrade flow.
 - **Backend:** New `follows`, `coach_grants`, `gym_leaderboard_opt_ins` tables; Stripe (or equivalent) billing integration.
 - **Database:** Straightforward relational additions on top of the now-real multi-tenant model from Phase 2.
 - **Dependencies:** Everything from Phases 1–3 (credibility grading must exist before a feed or leaderboard is worth building around).
 - **Risks:** This is where "generic social app" scope creep is most tempting — every feature here must stay tied to credibility-graded data, not become a generic activity feed, or the product drifts back into Strava-clone territory the user explicitly ruled out.
 - **Acceptance criteria:** A gym leaderboard only shows members who explicitly opted in; a coach grant is revocable by the athlete at any time.
 - **Complexity:** High (billing + multi-surface social features). **Order:** Fifth — deliberately last, since monetizing community value before the credibility layer exists would be monetizing a hollow product.
-

10. Technical Implementation Outline

Grounded in the audit's confirmed limitations (§3): 1. **Auth:** Adopt Supabase Auth (already the project's database), replacing hardcoded `userId="me"` throughout `app/`, `lib/tiles/tileStore.ts`, and `app/api/vitals/ingest/route.ts`. 2. **RLS rewrite:** Replace `using (true)` policies on `tile_data / tiles` with `auth.uid() = user_id` scoping — review (don't blindly adopt) the dormant `backend.sql` schema as a starting reference. 3. **Storage:** Add Supabase Storage (or equivalent) for evidence media — no existing pattern in the codebase to extend, this is genuinely new infrastructure. 4. **New API routes:** Follow the established Spotify/Finnhub pattern (`app/api/<service>/*`, host-proxied, since sealed tiles can't call out directly) for every new integration and social read/write path. 5. **Data model additions:** `competition_results`, `evidence`, `witness_confirmations`, `follows`, `coach_grants` — all additive, none require touching Train's existing lift-history schema. 6. **Preserve:** Train's data shape, Velocity's `prMoments()` / `bestOf()` logic, the tile-bridge security model, and the sealed no-network tile architecture — all confirmed strong in the audit and load-bearing for the credibility feature set, not obstacles to it.

11. Features to Avoid

- Generic AI workout/program generation as a headline feature — saturated (Fitbod, Gravl, Hevy Trainer, FitnessAI all already do this well) and explicitly ruled out by the user's constraints.

- Deep nutrition/calorie tracking as a primary pillar — crowded (MyFitnessPal, Cal AI, MacroFactor), not differentiated, not the wedge.
 - Live certified-trainer verification — explicitly excluded; the confidence-badge/evidence/witness model achieves credibility without it.
 - Subscription-gated core functionality (hardware-bricking à la WHOOP, or retroactively paywalling previously-free features à la Strava's Year in Sport, Oura's litigation) — directly contradicts an ownership/trust-based positioning.
 - Manufactured urgency mechanics (streaks, guilt notifications, artificial scarcity) — explicitly against the user's stated retention philosophy; retention should come from accumulated history and identity, not engagement-loop pressure.
 - Building toward Garmin integration as a near-term plan — their developer program is reportedly closed to new applicants; don't roadmap around access that may not be grantable.
 - A generic public activity feed untethered from credibility grading — the single easiest way for this product to drift back into "another Strava clone," which the user explicitly ruled out.
-

12. Final Verdict

PR Portfolio has a real, defensible opportunity — but it does not exist yet, and the current codebase's PR Portfolio branding is currently ahead of its architecture. The good news is that what's already built (deterministic PR/1RM derivation, a disciplined tile-security model, a half-sketched credibility data model) is precisely what the winning position needs, so nothing has to be rebuilt. The whitespace is real and specific: **no competitor grades the credibility of a personal athletic record**, and the tools to close that gap (OpenPowerlifting's open data, a straightforward evidence-upload pipeline, an honest rendering of the `RecordStatus` type that already exists in the code) are neither exotic nor expensive relative to the value they unlock. The risk is not technical — it's positioning discipline: every roadmap phase in this report is one AI feature, one social feed, or one gamification mechanic away from becoming a generic fitness app in a category that already has too many. Held to the credibility-first thesis, this is a buildable, differentiated, payable product.

Appendix A — Competitor Dossier (26 platforms, sourced)

Full per-platform findings from the three research passes conducted 2026-07-30, preserved in detail for reference. Condensed here to the most decision-relevant facts per platform; see inline citations for verification.

Logging / programming apps

- **Strava** — social endurance network; "Athlete Intelligence" AI + native MCP connector (launched June 2026); \$11.99/mo or \$79.99/yr; backlash over paywalling the once-free "Year in Sport" recap. strava.com/pricing, press.strava.com (2026-07-30)
- **Hevy** — free-first strength logger with real social layer; "Hevy Trainer" auto-progression (Feb 2026); \$2.99/mo Pro; 9-10M+ users, ~\$600-800K MRR, organic growth. hevyapp.com, tracxn.com (2026-07-30)
- **Strong** — radically minimal logger, no social/AI; \$4.99/mo per official App Store listing; 4.9/5, 108K+ ratings. [App Store](https://apps.apple.com) (2026-07-30)
- **Fitbod** — AI-personalized workout generator; needs ~10-15 logged workouts for full personalization; \$15.99/mo; no social layer. fitbod.me/blog/fitbod-algorithm (2026-07-30)
- **Boostcamp** — free 11,000+ named-coach program library ("Strength Score" 0-100); Pro \$4.99-14.99/mo. boostcamp.app/pro (2026-07-30)
- **TrainHeroic** — coach-to-athlete SaaS/marketplace; \$9.99-399.99/mo scaled by athlete count; zero wearable integrations, a real gap. trainheroic.com/pricing (2026-07-30)
- **Ladder** — team/cohort-based coached training; \$14.99-29.99/mo; iOS-only (third-party claim, not officially confirmed). joinladder.com/pricing (2026-07-30)
- **Future** — human 1:1 coaching, \$149-199/mo, by far the most expensive product researched; no AI, positioned explicitly against algorithmic apps. future.co (2026-07-30)
- **Gravl** — fully AI-automated programming with a single "Strength Score" metric, leaderboard, wearable integrations (Apple Health, Garmin, Strava); \$10.99/mo; 1.4M downloads, ~\$440K/mo revenue. gravl.ai (2026-07-30)
- **EvolveAI** — AI powerlifting programming; **official Powerlifting America app** (a real federation-endorsement credibility signal); \$14.99-20.99/mo. evolvetrainingapp.com (2026-07-30)
- **Beyond the Whiteboard** — CrossFit gym analytics + operations SaaS; deepest movement-level analytics in category, 200K+ athlete leaderboard; \$9.99/mo. beyondthewhiteboard.com (2026-07-30)
- **FitnessAI, Load Muscle** (newer, own discovery) — narrow algorithmic-progression and free-tier-first AI planning respectively; both signal free-tier-first AI as an emerging norm. aichief.com, loadmuscle.com (2026-07-30)

Wearables / recovery

- **WHOOP** — subscription-gated hardware (bricked without membership, source of 2025 backlash); **open self-serve developer API**; \$30/mo or \$17-20/mo annualized; Strength Trainer measures muscular load directly. developer.whoop.com (2026-07-30)
- **Garmin Connect** — free core tier (not hardware-gated); Connect+ AI add-on \$6.99/mo drew backlash as "restating the obvious"; **developer API partner-approval-only, reportedly closed to new applicants in 2026**. developer.garmin.com (2026-07-30)

- **Apple Health/Fitness** — free, universal data hub; HealthKit open to any developer but device-local/requires a native iOS app; ambitious AI health coach ("Mulberry") shelved Feb 2026. developer.apple.com/documentation/healthkit (2026-07-30)
- **Oura** — ring form factor; open API v2 but gated by the end user's own active membership; women's-health-specific proprietary LLM (Oura Advisor); currently facing a bait-and-switch class-action lawsuit. cloud.ouraring.com/docs (2026-07-30)
- **Bevel** — free WHOOP-style scoring for Apple Watch/Fitbit owners (no proprietary hardware); no public API despite user demand. apps.apple.com/bevel (2026-07-30)
- **Athlytic** — minimalist Apple-Watch-only recovery score; strong privacy positioning (never leaves Apple Health); no public API. apps.apple.com/athlytic (2026-07-30)
- **Peloton** — best-in-class social/leaderboard/points system (Club Peloton); most advanced AI (Peloton IQ) is hardware-gated to new equipment; no official public API. onepeloton.com/peloton-iq (2026-07-30)
- **Nike Run Club** — 100% free, no paid tier; **actively blocked third-party API access in 2024** — the weakest data-portability story researched, a useful cautionary contrast for PR Portfolio's ownership stance. rungap.zendesk.com (2026-07-30)

Nutrition / credibility references

- **Cal AI** — viral AI photo-calorie logging, acquired by MyFitnessPal (deal closed Dec 2025); opaque quiz-gated pricing; briefly pulled by Apple in April 2026 over deceptive billing. techcrunch.com (2026-07-30)
- **MyFitnessPal** — largest food database (20M items); free tier capped at 5 entries/day; \$19.99-24.99/mo. support.myfitnesspal.com (2026-07-30)
- **MacroFactor** — algorithmic weekly TDEE recalculation, not AI-generated coaching; publicly documented methodology builds trust with a technical audience; \$5.99-11.99/mo, no free tier. macrofactor.com (2026-07-30)
- **StrengthLevel** — free percentile-ranking calculator from ~195.5M crowd-sourced lifts (27.9M users) with statistical outlier-filtering; unverified but self-cleaning at scale. strengthlevel.com/strength-standards (2026-07-30)
- **OpenPowerlifting** — free, open, hand-verified archive of federation competition results; correction-by-authoritative-source; tested/untested segmentation; full bulk CSV export. **The gold-standard credibility model for PR Portfolio to learn from.** openpowerlifting.org (2026-07-30)

Full field-by-field detail (onboarding, retention mechanics, exact complaint sourcing) for every platform above is available in the raw research transcripts if needed for a deeper follow-up pass.
